

Defense (Qwen3-8B)	AgentDyn ASR % $\downarrow$	AgentDojo ASR % $\downarrow$	AgentDyn benign % $\uparrow$
No defense	22.1	20.5	26.7
ODILE	0.0 -22.1	1.3 -19.2	20.0 -6.7

Table 1: **AgentDyn (Qwen3-8B) — ASR and benign utility.** Dynamic, LM-generated benchmark on three suites that do not exist in AgentDojo (GitHub / Daily-Life / Shopping), `important_instructions` family, full $n=560$. The attack genuinely lands on the base agent (AgentDyn ASR 22.1%, Wilson [18.9, 25.8], trace-validated `send_money`/checkout hijacks concentrated in Daily-Life) and ODILE drives it to 0.0% (Fisher exact $p \approx 8 \times 10^{-13}$); on the same backbone ODILE also holds AgentDojo ASR at 1.3% (base 20.5%). Benign utility is largely preserved at 20.0% (base 26.7%, a 6.7 pp drop), so ODILE defends while keeping benign capability. Big number = value; small colored delta = change vs. base (**green** = improvement, **red** = cost). Cross-backbone extension is a camera-ready commitment.
